

**Name: AbdelRahman Moustafa Mohamed Abdallah**

**Groub name: AWS Cloud Specialist (ALX1\_SW D8\_M1e)**

**Student ID: 1110242719**

**AWS Academy Lab Project - Cloud Web Application Builder**  
**Building a Highly Available, Scalable Web Application**

**Supervise by: Eng. Merhan Adel**

**Badge Link**

## About Project

Deploy a web app on EC2, migrate the database to RDS, and ensure high availability and scalability using a load balancer and an Auto Scaling group.

## Steps for the Project:

### Phase 1: Planning the Design and Estimating Cost

1. **Creating an Architectural Diagram:**
  - Design an architecture diagram illustrating the AWS services and their interactions.
2. **Developing a Cost Estimate:**
  - Use the AWS Pricing Calculator to estimate the cost of running the solution in the us-east-1 region for 12 months.

### Phase 2: Creating a Basic Functional Web Application

1. **Creating a Virtual Network:**
  - Set up a virtual private cloud (VPC) and necessary subnets for hosting the application.
2. **Creating a Virtual Machine:**
  - Deploy a virtual machine (EC2) with the latest Ubuntu AMI to host the web application.
3. **Testing the Deployment:**
  - Ensure the web application is accessible from the internet and functions correctly (view, add, delete, modify records).

### Phase 3: Decoupling the Application Components

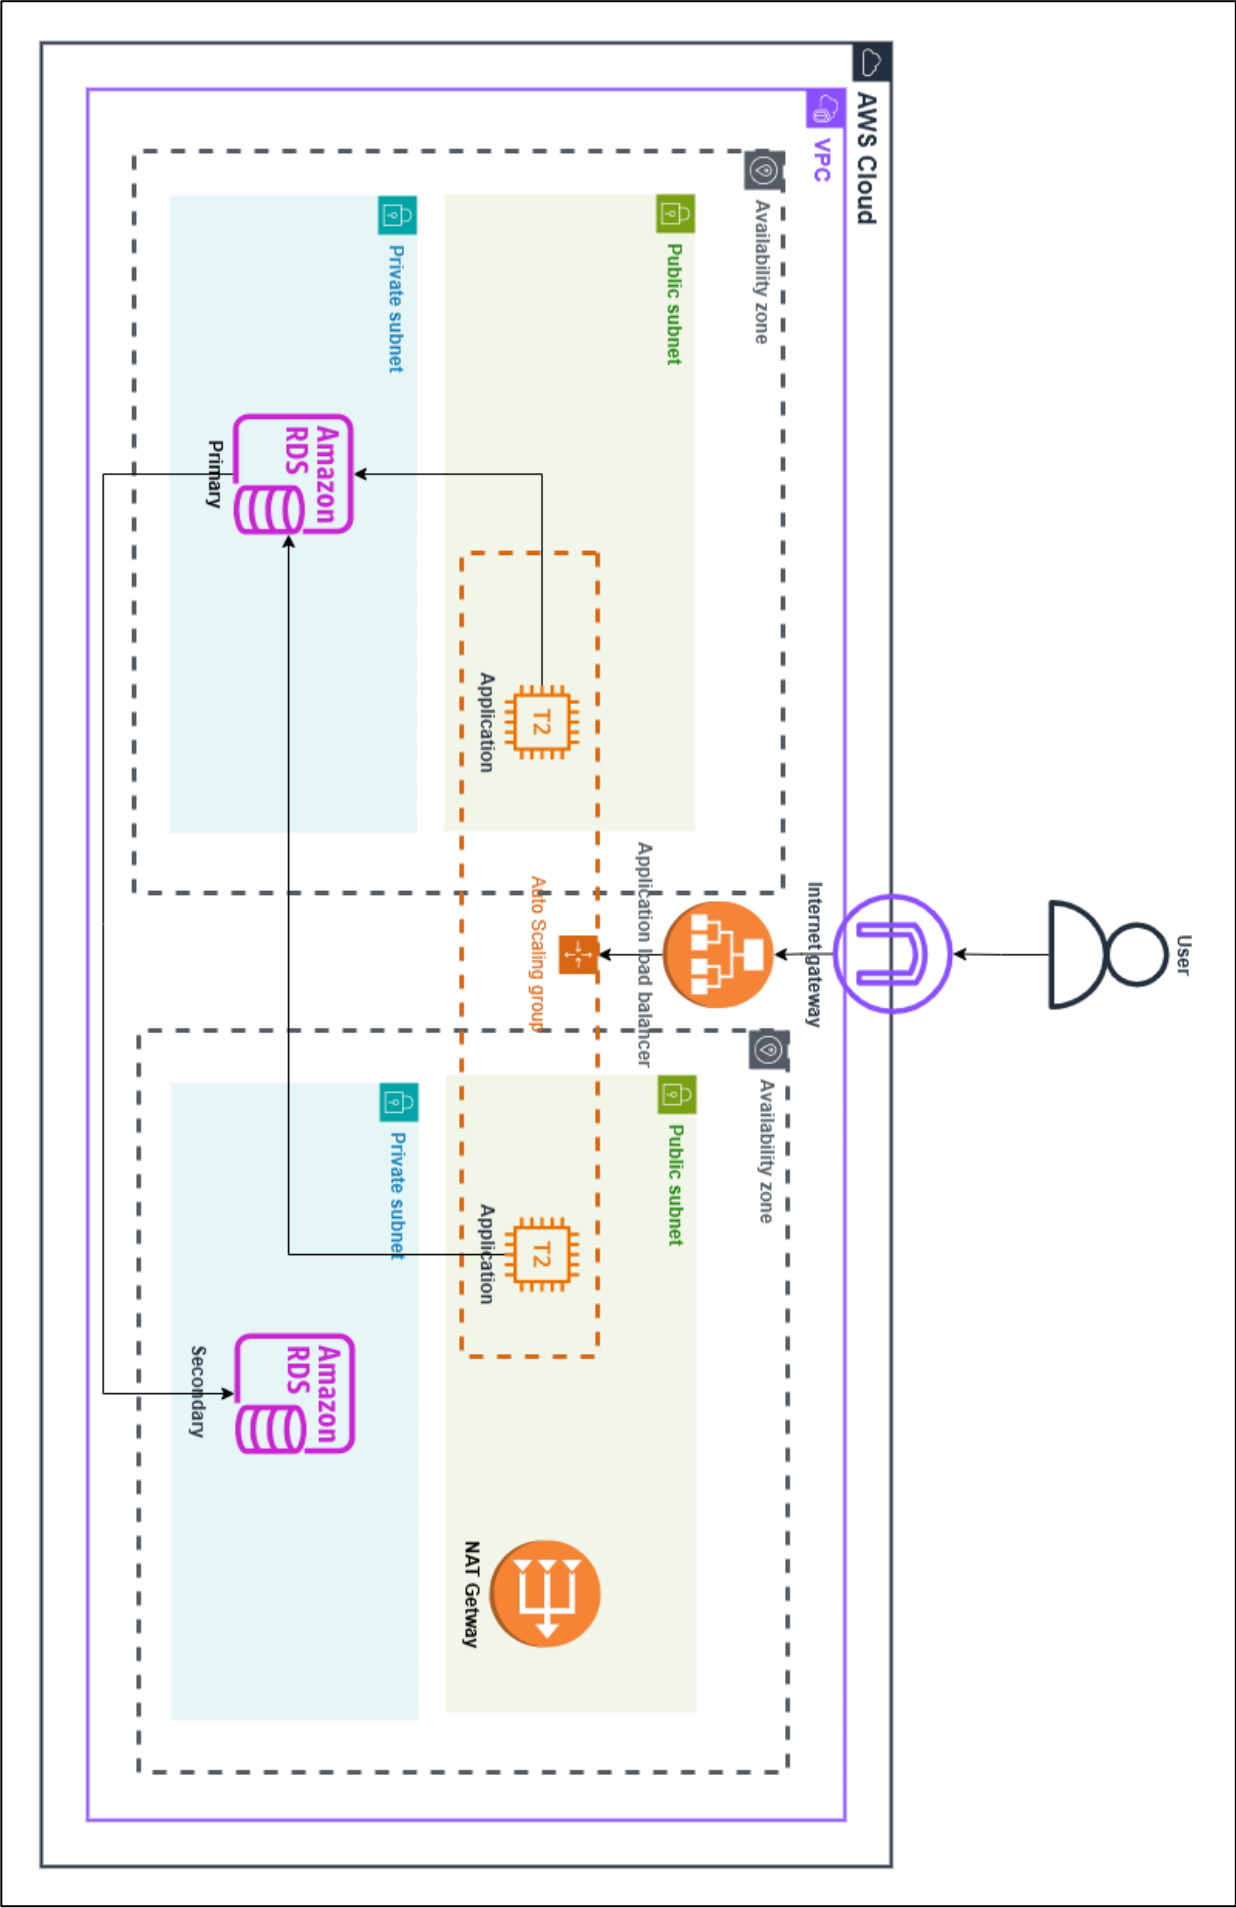

1. **Changing the VPC Configuration:**
  - Update or recreate the VPC to support separate hosting for the database and web server.
2. **Creating and Configuring the Amazon RDS Database:**
  - Set up an Amazon RDS instance running a MySQL engine, ensuring only the web application can access it.
3. **Configuring the Development Environment:**
  - Provision an AWS Cloud9 environment for executing AWS CLI commands.
4. **Provisioning Secrets Manager:**
  - Use AWS Secrets Manager to store database credentials securely and configure the web application to use these credentials.
5. **Provisioning a New Instance for the Web Server:**
  - Deploy a new EC2 instance for the web application or reconfigure the existing instance to connect to Amazon RDS.
6. **Migrating the Database:**
  - Migrate data from the original database on the EC2 instance to the new Amazon RDS database.
7. **Testing the Application:**
  - Verify the application functionality by performing CRUD operations on student records.

### Phase 4: Implementing High Availability and Scalability

1. **Creating an Application Load Balancer:**
  - Set up an Application Load Balancer across at least two Availability Zones.
2. **Implementing Amazon EC2 Auto Scaling:**
  - Create a launch template and an Auto Scaling group to manage EC2 instances hosting the web application.
3. **Accessing the Application:**
  - Test application functionality by performing CRUD operations again.
4. **Load Testing the Application:**
  - Conduct a load test using scripts to simulate 1,000 requests to evaluate performance under load.

Phase 1: Planning the design and estimating cost

Task 1: Creating an architectural diagram [Link Diagram](#)

## Task 2: Developing a cost estimate [Link CSV File](#)

### 1. Application Load Balancer (ALB) :

- Monthly Cost: \$16.46
- Annual Cost: \$197.52
- Quantity: 1

### 2. Amazon EC2 :

- Monthly Cost: \$40.16
- Annual Cost: \$481.92
- Configuration: 4 t2.micro instances running on Linux, utilizing 700 hours per month, with 20 GB of EBS storage.

### 3. Amazon RDS for MySQL :

- Monthly Cost: \$14.20
- Annual Cost: \$170.40
- Configuration: 1 db.t3.micro instance with 20 GB of gp3 SSD storage, deployed in a single availability zone.

## The Total Cost:

### Monthly Payments:

- Total Monthly Cost: \$70.82 USD  
You will pay \$70.82 each month for the services provided (Application Load Balancer, EC2 instances, and RDS for MySQL).

### Yearly Payments:

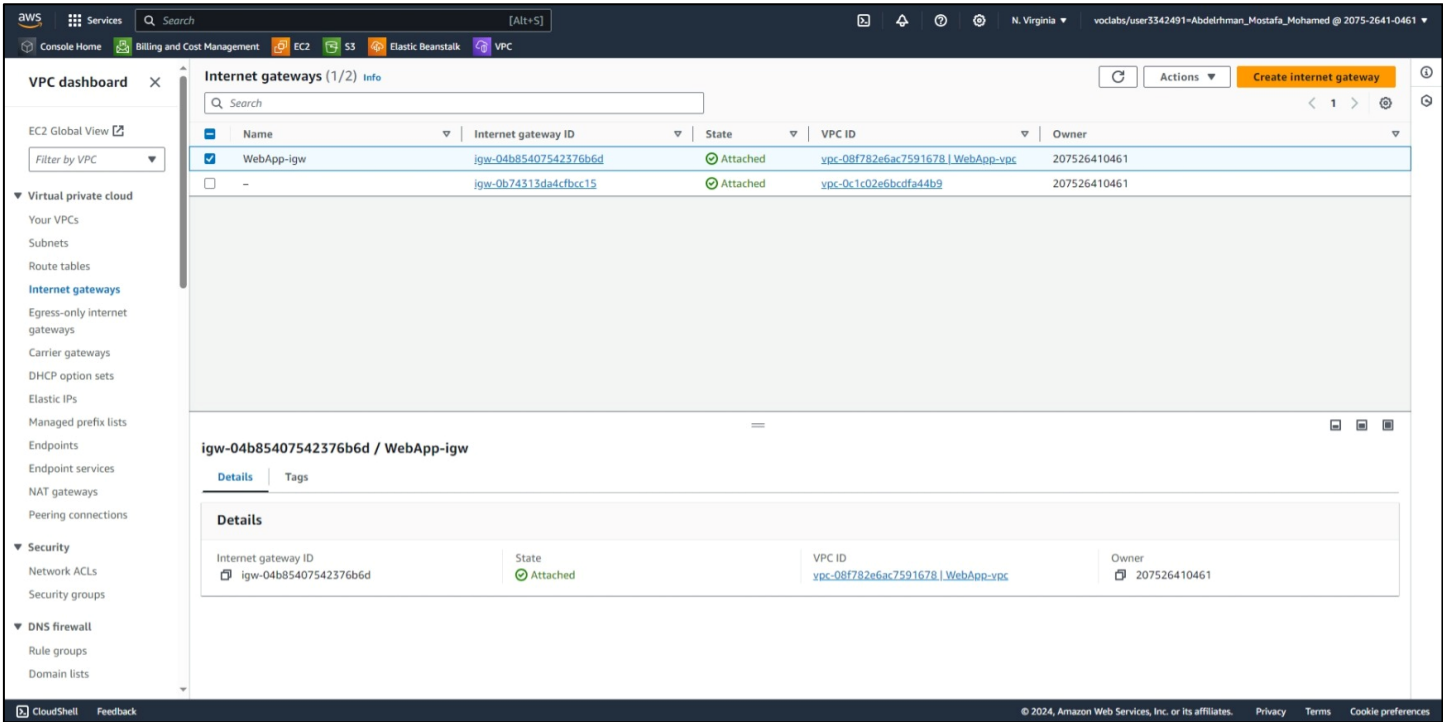

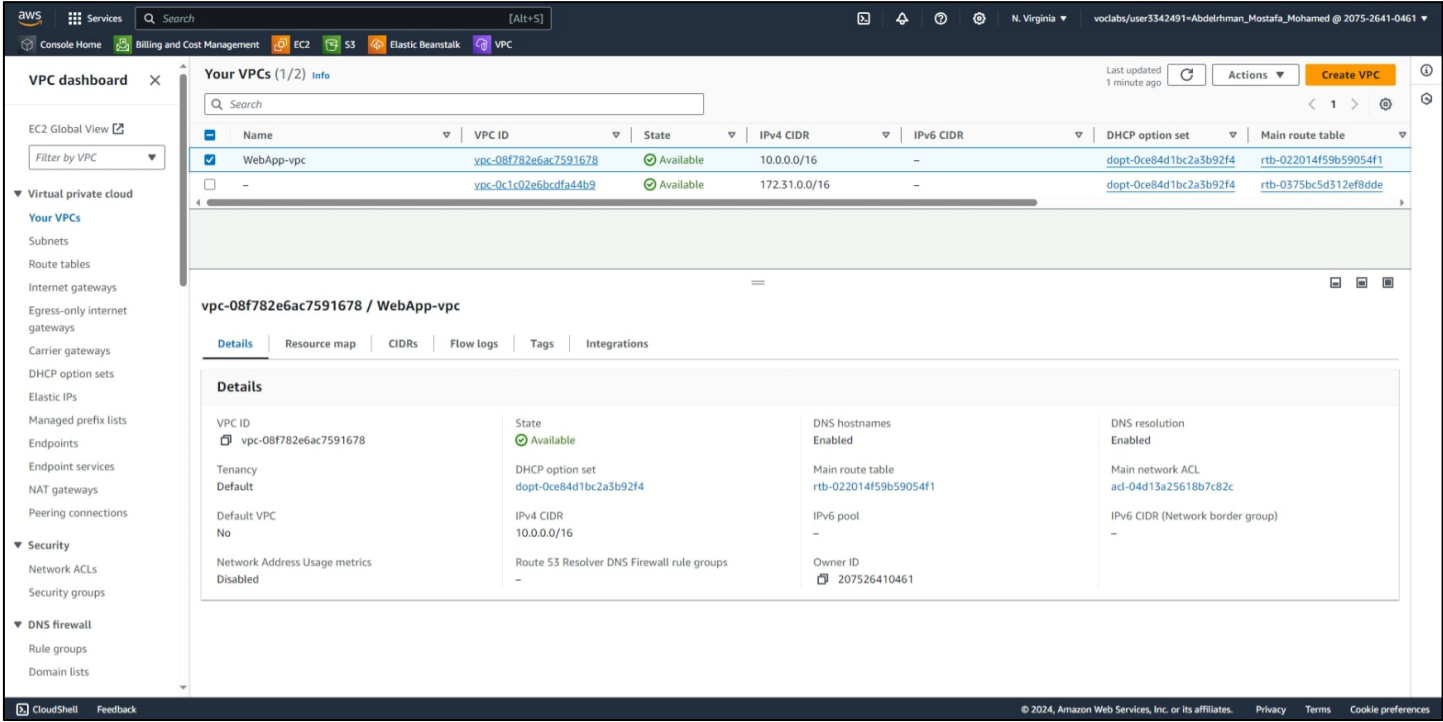

- Total Yearly Cost: \$849.84 USD  
If you choose to pay annually, the total amount due for the 12 months will be \$849.84 USD.

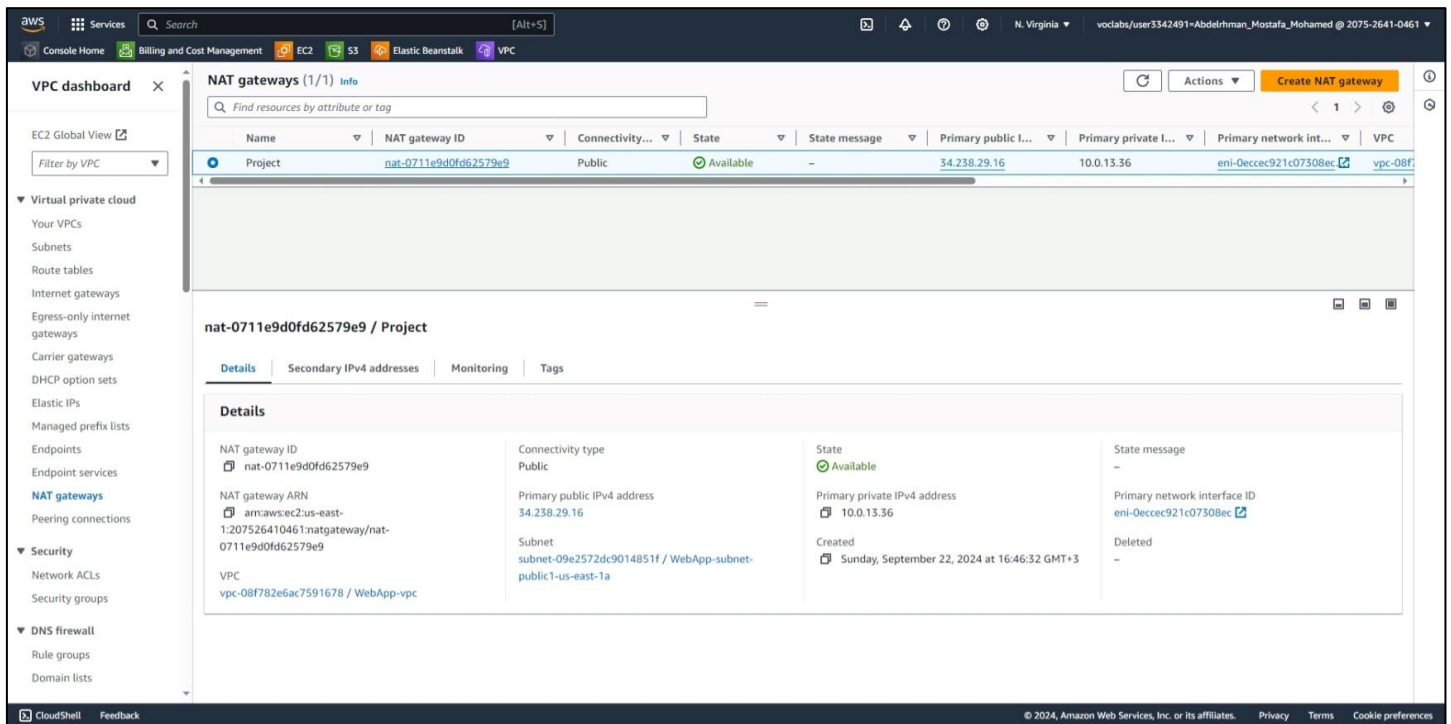

This setup assumes no upfront payments and is based on on-demand pricing.

---

# Phase 2: Creating a basic functional web application

## Task 1: Creating a virtual network

## Security Groups [File Link](#)

### 1) EC2-SG (Security Group for EC2 Instances):

- **Description:** This security group is used for EC2 instances, allowing inbound SSH (port 22) and HTTP (port 80) access. It is ideal for controlling remote access and web traffic to the EC2 instances.
- **Inbound Rules:** 3 rules, likely including SSH, HTTP, and another service-specific rule.
- **Outbound Rules:** 1 rule, usually allowing all outbound traffic.

### 2) DB-SG (Database Security Group):

- **Description:** This security group is designed for database instances, allowing inbound MySQL traffic on port 3306, ensuring secure database access.
- **Inbound Rules:** 1 rule for MySQL (port 3306) access.
- **Outbound Rules:** 1 rule, likely allowing all outbound traffic.

### 3) ELB-SG (Security Group for Elastic Load Balancer):

- **Description:** This security group is for the Elastic Load Balancer (ELB), allowing inbound traffic for load-balanced services such as HTTP and HTTPS.
- **Inbound Rules:** 2 rules, probably for HTTP (port 80) and HTTPS (port 443) traffic.
- **Outbound Rules:** 1 rule, typically allowing all outbound traffic.

## Task 2: Creating a virtual machine

# Phase 3: Decoupling the application components

## Task 1: Changing the VPC configuration

Note: You need private subnets in a minimum of two Availability Zones.

The screenshot shows the AWS VPC console. On the left is the navigation menu with categories like Virtual private cloud, Security, DNS firewall, and Network Firewall. The main area displays a list of subnets for VPC vpc-08f782e6ac7591678. Below the list, the details for subnet-05b5421eef52d0de3 are shown, including its ARN, CIDR, and associated VPC.

Name	Subnet ID	State	VPC	IPv4 CIDR	IPv6 CIDR	IPv6 CIDR association
WebApp-subnet-private1-us-east-1a	subnet-05b5421eef52d0de3	Available	vpc-08f782e6ac7591678   WebApp-vpc	10.0.128.0/20	-	-
WebApp-subnet-public1-us-east-1a	subnet-09e2572dc9014851f	Available	vpc-08f782e6ac7591678   WebApp-vpc	10.0.0.0/20	-	-
WebApp-subnet-private2-us-east-1b	subnet-0f3c791425e2afc1c	Available	vpc-08f782e6ac7591678   WebApp-vpc	10.0.144.0/20	-	-
WebApp-subnet-public2-us-east-1b	subnet-0b13efdfdb607f84	Available	vpc-08f782e6ac7591678   WebApp-vpc	10.0.16.0/20	-	-

**subnet-05b5421eef52d0de3 / WebApp-subnet-private1-us-east-1a**

**Details**

Property	Value
Subnet ID	subnet-05b5421eef52d0de3
Subnet ARN	arn:aws:ec2:us-east-1:207526410461:subnet/subnet-05b5421eef52d0de3
State	Available
IPv4 CIDR	10.0.128.0/20
Availability Zone	us-east-1a
VPC	vpc-08f782e6ac7591678   WebApp-vpc
Auto-assign public IPv4 address	No
Outpost ID	-
Hostname type	IP name

The screenshot shows the AWS VPC console with the 'Your VPCs' list. Below the list, the 'Resource map' for vpc-08f782e6ac7591678 is displayed, showing a visual representation of the VPC's components and their connections.
